1 The guiding center coordinates

are conserved, namely they commute with the Hamiltonian, and we have

$$[X, Y] = [x + l^2 \pi_v, y - l^2 \pi_x] = -i l^2$$

Notice that they travel on equipotential lines:

$$i\dot{X}_1 = [X_1, V] = -il^2 \partial_2 V$$
$$i\dot{X}_2 = [X_2, V] = +il^2 \partial_1 V$$

2 Spin-waves and magnons

The Schwinger-boson representation

$$S_{+} = a^{\dagger} b$$

$$S_{-} = b^{\dagger} a$$

$$2S_{z} = a^{\dagger} a - b^{\dagger} b$$

gives us the Holstein-Primakoff transformation if we use the constraint

$$a^{\dagger}a + b^{\dagger}b = 2S$$

The spin-wave is obtained by, e.g., expanding around $S_z = -S$, namely setting

$$b = b^{\dagger} = \sqrt{2S - a^{\dagger}a} \approx \sqrt{2S}$$

3 The Bogoliubov transformation

In order to diagonalize a Hamiltonian of the form

$$\Psi_{i\dagger}A_{ij}\Psi_{j}$$

while keeping the commutation relations, we want

$$U^{\dagger}AU = \Lambda$$

where Λ is a diagonal matrix, as well as

$$C_{ij} = [\Psi_i, \Psi_{j\dagger}] = [U_{ik}\Phi_k, U_{jl*}\Phi_{l\dagger}] = U_{ik}U_{jl*}C_{kl} \Rightarrow C = UCU^{\dagger}$$

where *C* is, by assumption, a diagonal matrix. Therefore we have

$$CAU = UCU^{\dagger}AU = UC\Lambda$$

which means that U diagonalizes the matrix CA, with eigenvalues $C\Lambda$.

4 The three-plus-one decomposition

In Minkowski spacetime, we have

$$V^a = -V^b Z_b Z^a + W^a$$

such that W^a is a spatial vector

$$W^{a}Z_{a} = V^{a}Z_{a} + V^{b}Z_{b}Z^{a}Z_{a}$$
$$= V^{a}Z_{a} - V^{b}Z_{b}$$
$$= 0$$

Notice also that $Z^b\nabla_bZ^a$ is a spatial vector, since $Z^b\nabla_bZ^aZ_a=0$.
